

AbleSpace Assessment – Figma Task Management

Complete screen-by-screen flow and working understanding based on the 14 screenshots provided.

Overall flow – simple version

Step	What happens
Step 1 – Entry	Guest opens the app → Login screen → Continue as Guest or Google Login.
Step 2 – Workspace	After authentication → Workspace opens → Tasks is the default working area.
Step 3 – Task management	User can create tasks, view them in Board/List, search, filter, edit properties and open task details.
Step 4 – Task detail	Task detail supports priority, members, labels, dates, subtasks, resources and comments/updates.
Step 5 – View customization	Fields menu lets the user control visible columns/fields and switch Board/List.
Step 6 – Projects	Projects section provides project-level task organization, filters and project/task navigation.
Step 7 – Personalization	Profile menu → Theme/Color Mode → application appearance changes and should persist.
Step 8 – Account settings	Settings → Profile → update account information or leave the workspace.

What the application is managing

Users: guest/login identity, profile, workspace access.

Workspace: Tasks and Projects.

Tasks: status, title, priority, members, due dates, labels, reporter, subtasks, resources and comments/updates.

Views: Board and List.

Customization: visible fields, theme and color mode.

Projects: project list, filters and project-to-task navigation.

1. Guest Login

User first reaches the login screen. The design offers **Continue as Guest** as the primary path and **Login with Google** as an alternative. Terms and Privacy links are shown below. For this assessment, Guest Login should be a real working authentication entry point.

Screenshot 1 of 14

2. Main Tasks – Board View

After login, the user reaches the workspace. The left sidebar contains the workspace identity and two main areas: **Tasks** and **Projects**. Tasks are shown as a Kanban/board with status columns such as To Do, Doing, Completed and On Hold. Each task card contains title, member, labels and due date. Users can add tasks directly from a column or with the top-right Add Task button.

Screenshot 2 of 14

3. Fields / View Configuration

The Fields button controls which information is visible in the task view. The user can switch between **List** and **Board** and toggle fields such as Priority, Members, Due Date, Labels, Status and Reporter. This means the task screen is customizable rather than a fixed table.

4. Tasks – List View

List view groups tasks by status. Each section has rows with Task, Priority, Members, Due Date and Actions. Users can add a task from each section. The same underlying task data is therefore presented in two views: Board and List.

Develop Login Feature	Low	CN	15 Sep 2026	...
Test Payment Gateway	Medium	+	18 Sep 2026	...

5. Task Search / Filtered Result

The search control filters the task list. In the example, a search for **Design Homepage** leaves only the matching task visible. The implementation should make this interactive, not a visual-only search box.

Screenshot 5 of 14

6. Task Details + Priority

Opening a task shows a detailed task page. It contains title, description, properties, labels, resources, subtasks, comments/updates and a right-side Details panel. Priority can be changed from the detail panel. This screen is the main place for editing task metadata and collaboration.

Screenshot 6 of 14

7. List View – Fields Menu

The Fields menu is available in List view as well. It allows users to decide which columns/details are displayed. This should update the visible table dynamically and persist if the product design expects user preferences to remain.

Screenshot 7 of 14

8. Task Details + Due Date Calendar

The task detail page also supports due-date editing. The calendar lets the user select a start/end date. Therefore due dates are not just display data; they are editable task properties connected to the task record.

9. Workspace Profile Menu + Theme

Clicking the workspace/profile area opens an account menu. It shows the user's avatar, name and email and provides access to **Change Theme**, **Color Mode** and **Settings**. This is the main global customization entry point.

Screenshot 9 of 14

10. Color Mode Selection

Color Mode provides a palette such as Amber, Blue, Pink, Rose, Emerald and Black. Selecting a color mode should change the application's accent/theme color consistently across the UI and persist after refresh.

Screenshot 10 of 14

11. Projects – Filter Menu

Projects have a similar table-based management experience. The filter menu exposes filters such as Status, Priority, Members, Due Date, Teams, Labels and Reporter, with nested options. This indicates filtering is a core interaction across the product.

Screenshot 11 of 14

12. Project / Task List

A project/task context shows grouped task sections with the same task metadata pattern. The breadcrumb at the top connects the user back to the broader workspace/project context. Projects and tasks are therefore linked entities, not isolated pages.

13. Profile Settings

Settings contains a Profile screen. The user can view/edit profile picture, email, full name, title/role and username. There is also Workspace Access with a **Leave Workspace** action. These are account-level settings rather than task-level settings.

14. Profile Settings – duplicate reference

This screenshot repeats the Profile Settings state. It confirms the intended profile layout and workspace-access section. It can be treated as the same screen/state when implementing the app.

Screenshot 14 of 14

Implementation understanding for Part 1

The frontend should reproduce these states with reusable Next.js + Tailwind components. The backend should expose clean NestJS APIs for authentication, tasks, projects, task members, subtasks, comments/updates and user preferences. The database should store the task/project data rather than relying only on static mock data. Search, filters, Board/List switching, task editing, date selection and theme/color persistence should be functional. Responsive behavior should preserve the same workflow on desktop, tablet and mobile.

Important assessment point

The screenshots show not only static pages but interactive states: menus, dropdowns, filters, calendar, search, view switching and profile customization. These interactions should be implemented as working UI behavior, not only copied visually.
